

Why are electric vehicles important?

- The global market for electric vehicles (EVs) is growing continuously, this growth is being driven by various factors including concerns about pollution.
- Electric vehicles or hybrids are the way forward because they can offer significant reductions in emissions over conventional vehicles.
- The major benefit of electric cars is the contribution that they can make towards improving air quality in towns and cities. With no tailpipe, pure electric cars produce no carbon dioxide emissions when driving. This reduces air pollution considerably.
- Some benefits of electric vehicles are: lower co<sub>2</sub>(carbon dioxide)emissions, lower running costs, reduced noise pollution, and less maintenance due to an efficient electric motor, no congestion charge, and government funding.
- One disadvantage is the fact that the infrastructure is not ready, which includes finding charging stations., and higher initial costs. In the UK, there are 33,281 public electric vehicle charging stations.
- I would be talking now about our website objective which is to inform people by giving them a wide variety of information about electric vehicles, about the economic and environmental benefits of owning an Ev. And also to convince people to switch to Ev by showing how it would benefit them and society
